

# Top 10 Security Vulnerabilities

Susam Pal

Based on OWASP Top Ten Project (2006)

[http://www.owasp.org/index.php/OWASP\\_Top\\_Ten\\_Project](http://www.owasp.org/index.php/OWASP_Top_Ten_Project)

Content is available under [Creative Commons Attribution-ShareAlike 2.5 License](http://creativecommons.org/licenses/by-sa/2.5/)

# Agenda

- ❖ Unvalidated Input
- ❖ Broken Access Control
- ❖ Broken Authentication
- ❖ Cross Site Scripting
- ❖ Buffer Overflows
- ❖ Injection Flaws
- ❖ Improper Error Handling
- ❖ Insecure Storage
- ❖ Denial of Service
- ❖ Insecure Configuration

# Unvalidated Input

All input is evil ....

.... until proven otherwise.

Types of Input:

- HTTP Requests
- Commands
- Network packets (TCP/IP, UDP, etc.)

# Unvalidated Input

## Common Input Tampering Attacks:

- Forced Browsing
- Command Insertion
- Cross Site Scripting
- Buffer Overflows
- SQL Injection
- Hidden Field Manipulation

# Unvalidated Input

## Microsoft IIS and PWS Extended Unicode Directory Traversal Vulnerability (BID 1806)

Web Root: C:\Inetpub\wwwroot\

### Unsafe Procedure:

```
map [URL] to [path of the resource] on the hard disk;  
if [path of the resource] starts with [C:\Inetpub\wwwroot]  
then  
    allow access;  
else  
    deny access;
```

# Unvalidated Input

Microsoft IIS and PWS Extended Unicode  
Directory Traversal Vulnerability (BID 1806)

Exploit:

`http://www.example.com/../../../../windows/system32/cmd.exe`

URL Mapped to Resource on Hard Disk:

`C:\Inetpub\wwwroot\..\..\windows\system32\cmd.exe`

What IIS/PWS forgot to check:

`C:\Inetpub\wwwroot\..\..\windows\system32\cmd.exe`

`= C:\Inetpub\..\windows\system32\cmd.exe`

`= C:\windows\system32\cmd.exe`

# Unvalidated Input

## Microsoft IIS and PWS Extended Unicode Directory Traversal Vulnerability (BID 1806)

### Safe Procedure:

```
map [URL] to [path of the resource] on the hard disk;  
canonicalize [path of the resource];  
if [path of the resource] starts with [C:\Inetpub\wwwroot]  
then  
    allow access;  
else  
    deny access;
```

### Reference:

<http://www.securityfocus.com/bid/1806>

# Unvalidated Input

## Prevention:

- Canonicalization: Input should be converted to the simplest form before they are validated.
- Server Side Validation: It is must. First code Server Side Validation, then code Client Side Validation.
- Validate against a positive (not negative) specification.
- Detailed code review for tainted parameters.

# Broken Access Control

Access control, sometimes called authorization, is how a web application grants access to content and functions to some users and not others.

## Features:

- Access control is closely associated with the content and functions of the application.
- Users are generally managed by putting them under various groups/roles with various privileges.

# Broken Access Control

## Common Mistakes:

- Administrative interfaces that allow site administrators to manage a site over the Internet.
- Insertion of access control rules in various locations all over the code on an ad hoc basis.

## Common Attacks:

- Exploiting Insecure Id's
- Forced Browsing Past Access Control Checks
- Path traversals
- Exploiting browser cache

# Broken Access Control

## How to disable Browser Cache:

### HTML <meta> Tag

```
<meta http-equiv="Pragma" content="no-cache">  
<meta http-equiv="Expires" content="-1">  
<meta http-equiv="Cache-control" content="no-cache">  
<meta http-equiv="Cache" content="no-cache">  
<meta http-equiv="Expires" content="thu, 01 Jan 1980  
12:00:00 GMT">
```

### ASP

```
<% Response.AddHeader "Pragma", "no-cache" %>  
<% Response.Expires = -1 %>  
<% Response.CacheControl="private" %>  
<% Response.CacheControl = "no-cache" %>  
<% Response.CacheControl = "no-store" %>
```

# Broken Access Control

## How to disable Browser Cache:

### JSP

```
<% response.setHeader("Pragma","no-cache"); %>  
<% response.setHeader("Cache-Control","no-cache"); %>  
<% response.setDateHeader ("Expires", 0); %>  
<% response.setHeader("Cache-Control","no-store"); %>
```

### PHP

```
<?php  
Header("Pragma: no-cache");  
Header("Cache-control: private, no-cache, no-store");  
Header("Expires: Mon, 26 Jul 1997 05:00:00 GMT");  
?>
```

# Broken Authentication

## Types of Authentication:

- User ID and Password
- Software & Hardware based cryptographic tokens
- Biometrics

## Session Management:

- Web applications must establish sessions to keep track of the stream of requests from each user.
- HTTP doesn't provide this capability, so web applications must create it themselves.
- Generally developers create session tokens to manage sessions.

# Broken Authentication

## Common Attacks:

- “Walk by” Attacks
- Session Hijacking

## Prevention:

- Re-authentication for critical functionalities.
- Use of SSL to protect authentication credentials and session identifiers.
- Code review and penetration testing
- POST method to submit authentication & session data.
- Use autocomplete=“off” with <form> and <input> tags.
- Avoid implicit trust between components.

# Cross Site Scripting

XSS occurs when an attacker uses a web application to send malicious code, generally in the form of a script, to a different end user.

## Types of XSS attacks:

- Stored - Injected code is permanently stored on the target servers, such as in a database, forum, visitor log, comment field, etc.
- Reflected – Injected code is reflected off the web server, such as in an error message, search result, or any other response that includes some or all of the input sent to the server as part of the request.

# Cross Site Scripting

## Common Attacks:

- Annoyance to the end user.
- Redirecting the user to some other page or site
- Disclosure of the user's session cookie.
- Session hijacking.

## Prevention:

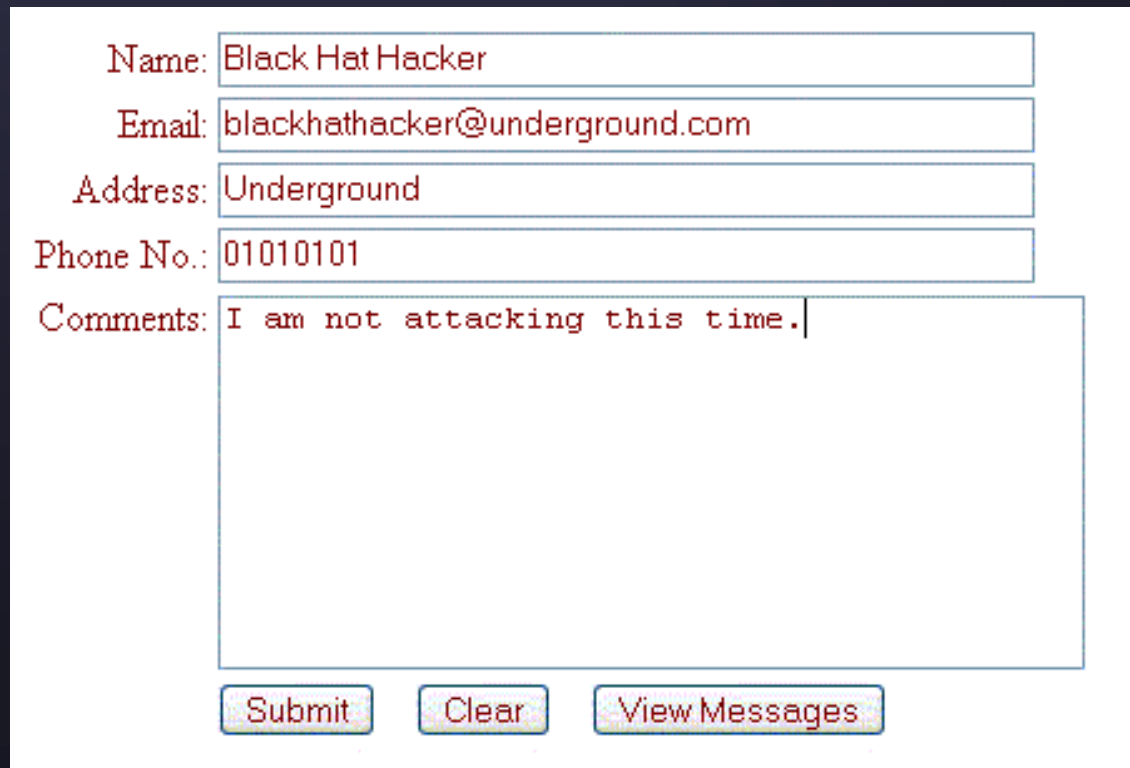

- Code review of all places where input from an HTTP request could possibly make its way into the HTML output.
- Validate all headers, cookies, query strings, form fields and all such inputs against a rigorous positive specification.

# Cross Site Scripting

## Community Architect Guestbook XSS (SA19742)

When the attacker is in a good mood:

A screenshot of a web form titled "Community Architect Guestbook XSS (SA19742)". The form is set against a light blue background. It contains five input fields, each with a label to its left: "Name:" with the value "Black Hat Hacker", "Email:" with the value "blackhathacker@underground.com", "Address:" with the value "Underground", "Phone No.:" with the value "01010101", and "Comments:" with the value "I am not attacking this time.". The "Comments" field is a larger text area. At the bottom of the form, there are three buttons: "Submit", "Clear", and "View Messages".

Name:	Black Hat Hacker
Email:	blackhathacker@underground.com
Address:	Underground
Phone No.:	01010101
Comments:	I am not attacking this time.

# Cross Site Scripting

## Community Architect Guestbook XSS (SA19742)

Where the input goes:

```
<!-- Guestbook Insertion Point -->
<table border="0" cellpadding="2" cellspacing="0">
<tbody><tr><td align="right"><b>Name:</b></td><td>Black Hat Hacker</td></tr>
<tr><td align="right"><b>Email:</b></td><td><a
href="mailto:blackhathacker@underground.com">blackhathacker@underground.com</a></td></tr>
<tr><td align="right" valign="top"><b>Comments:</b></td><td width="500">I am
not attacking this time</td></tr>
<tr><td align="right" valign="top"><b>Address:
</b></td><td valign="top">Underground</td></tr>
<tr><td align="right" valign="top"><b>Phone No.:
</b></td><td valign="top">01010101</td></tr>
<tr><td></td><td><font size="2">August 1, 2005 16:20:04 (GMT
Time)</font></td></tr>
</tbody></table>
<br>
<hr size="2" width="80%">
<br>
```

# Cross Site Scripting

## Community Architect Guestbook XSS (SA19742)

### The Output:

Sign the Guestbook

---

**Name:** Black Hat Hacker

**Email:** [blackhathacker@underground.com](mailto:blackhathacker@underground.com)

**Comments:** I am not attacking this time.

**Address:** Underground

**Phone No.:** 01010101

August 1, 2005 16:20:04 (GMT Time)

# Cross Site Scripting

## Community Architect Guestbook XSS (SA19742)

If the attacker attacks:

A screenshot of a web form titled "Community Architect Guestbook". The form contains several input fields and a large text area for comments. The fields are filled with the following data:

- Name: Black Hat Hacker
- Email: blackhathacker@underground.com
- Address: Underground
- Phone No.: 01010101
- Comments: 

```
<script>
for(i=0; i<10; i++)
{
  x = Math.floor(Math.random() * 800)
  y = Math.floor(Math.random() * 600)
  window.open('http://www.blackhat.com/ima
'width=280,height=280,left='+x+' ,top='
+ y + ',screenX='+x+' ,screenY=' + y)
```

At the bottom of the form, there are three buttons: "Submit", "Clear", and "View Messages".

# Cross Site Scripting

## Community Architect Guestbook XSS (SA19742)

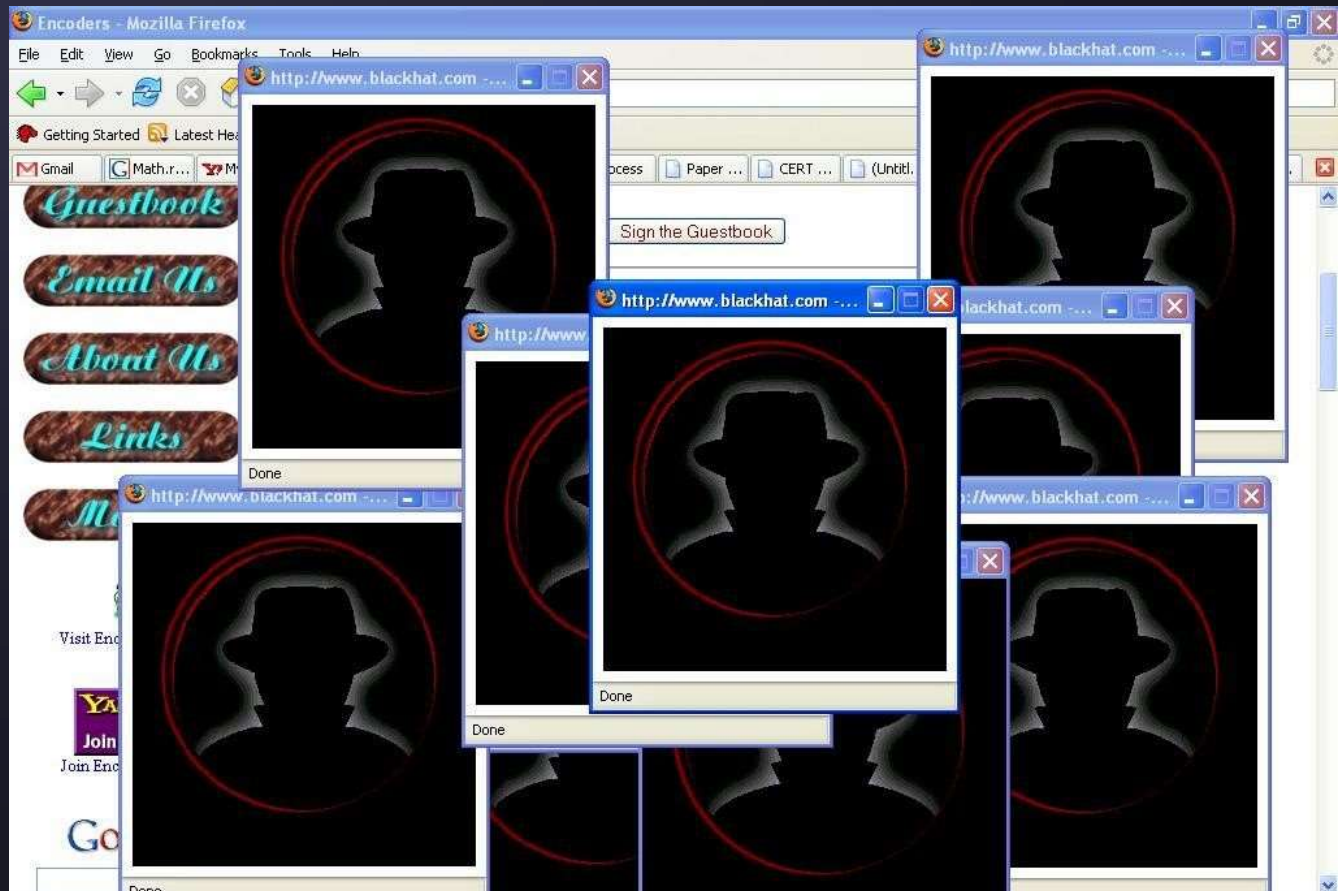

Where the input goes:

```
<!-- Guestbook Insertion Point -->
<table border="0" cellpadding="2" cellspacing="0">
<tbody><tr><td align="right"><b>Name:</b></td><td>Black Hat Hacker</td></tr>
<tr><td align="right"><b>Email:</b></td><td><a

# Cross Site Scripting

If text formatting should be allowed.

Tags that can be allowed:

`<p>`

`<b>`

`<u>`

`<i>`

`<strike>`

`<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>`

# Buffer Overflows

Attackers use buffer overflows to corrupt the execution stack of an application.

Buffer overflows are easy to avoid, difficult to discover and extremely difficult to exploit.

## Types of Attacks:

- Attackers send carefully crafted input to a web application, an attacker can cause the application to execute arbitrary code.
- When difficult to exploit, the attackers can crash the application thereby leading to DoS (Denial of Service).

# Buffer Overflows

```
#include <string.h>
```

```
void function(char *str)
{
    char buffer[4];
    strcpy(buffer, str);
}
```

```
main()
{
    char string[]="Hi!";
    function(string);
}
```

Return Address

# Buffer Overflows

## Major Attacks:

### Code Red Virus

Attacked a buffer overflow weakness in the Microsoft IIS Server API on July 19, 2001.

Damage: \$2.6 billion

### Sasser Worm

Attacked the Microsoft LSAS buffer overflow vulnerability on April 30, 2004.

Damage: \$3.5 billion

# Buffer Overflows

## Prevention:

- C Programmers now refrain from using `strcpy()`, `strcat()` in their programs. They use `strncpy()`, `strncat()` instead which perform bound checking. Never use `gets()`.
- Programmers now write their applications in languages like Java, Visual Basic which has better stack and memory management features.
- Sun Microsystems is trying to make their Sparc processor immune to stack overflow attack by introducing new feature to protect the return address during a subroutine call.

# Injection Flaws

Injection flaw lets you inject executable code at places where it is not allowed in a secure system which might lead to execution of the code and compromise of the system.

## Common Attacks:

- Relay malicious through a web application to another system.
- Calls to operating system via system calls.
- Use of external programs via shell commands.
- Calls to backend databases via SQL.
- Complete script injection into web applications.

# Injection Flaws

## SQL Injection:

- SQL injection is particularly widespread and dangerous form of injection.
- SQL Injection is possible if the value of any parameter is used in SQL queries and the parameter is not sanitised properly.
- The attacker can retrieve, modify, corrupt or destroy database contents.

# Injection Flaws

## Bloggage SQL Injection:

### Login:

Account Name

Password

Auto Login ☐

Login

*Note:* for auto login to work, cookies must be enabled.

Microsoft OLE DB Provider for ODBC Drivers error '80040e14'

[Microsoft][ODBC Microsoft Access Driver] Syntax error in string in query expression 'Account\_Name="blackhathacker" AND Password='.

/bloggage/check\_login.asp, line 24

```
SELECT <some_column> FROM <some_table> WHERE  
    Account_Name = '<user>' AND Password = '<password>'
```

```
SELECT <some_column> FROM <some_table> WHERE  
    Account_Name = 'blackhathacker' AND Password = ''
```

# Injection Flaws

## Bloggage SQL Injection:

```
SELECT <some_column> FROM <some_table> WHERE  
    Account_Name = '<user>' AND Password = '<password>'
```

```
SELECT <some_column> FROM <some_table> WHERE  
    Account_Name = 'blackhathacker' AND  
    Password = 'a' OR 'a' = 'a'
```

(Always a true condition)

Account Name: blackhathacker

Password: a' OR 'a' = 'a

# Injection Flaws

## Bloggage SQL Injection:

**Login:**

Account Name

Password

Auto Login ☐

*Note: for auto login to work,*

# Bloggage

### What do you want to do?

- ♦ Manage ([add](#)) news/blog items
- ♦ Manage ([add/modify or view/delete](#)) content
- ♦ Manage ([view or delete](#)) comments
- ♦ Manage ([modify](#)) layout of the site
- ♦ [Select](#) template for the site
- ♦ Manage ([add/modify/delete](#)) templates
- ♦ [Edit](#) options
- ♦ [Delete](#) an Account
- ♦ [Assign](#) privileges

# Injection Flaws

## Prevention:

- Avoid accessing external interpreters wherever possible.
- For calls to backend databases, carefully validate the data provided to ensure that it does not contain any malicious content.
- Structure requests in a manner that ensures that all supplied parameters are treated as data, rather than potentially executable content.
- Convert special characters to the correct form.
- Run the application with minimum privileges required.

# Improper Error Handling

Improper handling of errors can introduce a variety of security problems.

## Common Problems:

- Inconsistencies in error messages which can reveal important clues on how the system works.
- Stack traces, database dumps and error codes are displayed on error.
- Syntax errors are displayed along with portions of the codes.

# Improper Error Handling

## A Bad Error Message

**Login:**

Account Name	<input type="text" value="blackhathacker"/>
Password	<input type="password" value="XXXXXXXXXX"/>
Auto Login	<input type="checkbox"/>

# Improper Error Handling

## IncredibleIndia.org SQL Injection (WHID 2006-27)

A valid page:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828)

Trial 1:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828'](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828')

Error:

Unclosed quotation mark before the character string ' and  
mncpage.mnccategoryid = mnccategory.mnccategoryid'.

Conclusion:

Direct SQL Injection is possible. There are 2 tables, 'mncpage' and 'mnccategory'. Both of them have a column called 'mnccategoryid'.

# Improper Error Handling

## IncredibleIndia.org SQL Injection (WHID 2006-27)

Trial 2:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828 order by 1--](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828 order by 1--)

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828 order by 2--](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828 order by 2--)

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828 order by 3--](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828 order by 3--)

No error

# Improper Error Handling

## IncredibleIndia.org SQL Injection (WHID 2006-27)

Trial 3:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828 order by 4--](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828 order by 4--)

Error:

The ORDER BY position number 4 is out of range of the number of items in the select list.

Conclusion:

The table being used by the query selects 3 columns and one of them is an integer.

# Improper Error Handling

## IncredibleIndia.org SQL Injection (WHID 2006-27)

Trial 4:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828) union select 'varchar1', 'varchar2', 'varchar3' from mncpage --

Error:

Syntax error converting the varchar value 'varchar1' to a column of data type int.

Conclusion:

The 1st column in the select query is an integer.

# Improper Error Handling

## IncredibleIndia.org SQL Injection (WHID 2006-27)

Trial 5:

[http://www.incredibleindia.org/newsite/cms\\_Page.asp?PageID=828](http://www.incredibleindia.org/newsite/cms_Page.asp?PageID=828) union  
select mnccategoryid, 'varchar2', 'varchar3' from mncpage--

No Error

Conclusion:

The column 'mnccategory' is of integer type.

# Insecure Storage

Most applications need to store sensitive information, either in a database or on a file system.

## Types of Sensitive Information:

- Passwords
- Credit Card Numbers
- Account Records
- Proprietary Information

# Insecure Storage

## Common Mistakes:

- Failure to encrypt critical data
- Insecure storage of keys and passwords
- Improper storage of secrets in memory
- Poor sources of randomness
- Poor choice of algorithm
- Attempting to invent a new encryption algorithm

## Types of Attacks:

- Examining tokens, session IDs, cookies, etc. to see if they are obviously not random.
- Finding cryptographic flaws.

# Insecure Storage

## Prevention:

- Minimize encryption. Use it to keep information that is absolutely necessary.
- Instead of storing encrypted passwords, use a one-way function, such as a SHA-1, to hash the passwords
- If cryptography must be done, choose a library that has been exposed to public scrutiny and makes sure that there are no open vulnerabilities.
- Clear the clear-text sensitive information from the memory as soon as possible.

# Denial of Service

Denial of Service (DoS) attack is an attempt to make a computer service unavailable to its intended users.

## Common Attacks:

- Consume bandwidth, database connections, disk storage, CPU, memory, threads, or application specific resources.
- Locking out a legitimate user by sending invalid credentials until the system locks out the account.
- Exploiting buffer overflows & injection flaws to inject code/commands to shut down or stall important service.

# Denial of Service

## Overkill recv\_packet() UDP Handling Overflow DoS

The vulnerability was an integer underflow error in a Linux based gaming daemon called Overkill. It could be exploited to launch DoS attacks by sending UDP packets of size less than 12 bytes to the Overkill daemon.

### Prevention:

- Load balancing makes these attacks more difficult.
- Analyse each resource and check if there is a way to exhaust it.
- Limit resources to any user to bare minimum.
- Check error handling scheme and ensure that an error can not affect the overall operation of the system.

# Insecure Configuration

Insecure configuration of a system can itself be a potential vulnerability.

## Common Configuration Problems:

- Unpatched security flaws in a software.
- Server software flaws or misconfigurations that permit directory listing and directory traversal attacks
- Improper file and directory permissions
- Unnecessary services enabled
- Default accounts with default passwords
- Administrative or debugging functions that are enabled
- Improper authentication with external systems

# Insecure Configuration

## Apache URL Validation Vulnerability (BID 19447)

```
# Sample Safe Configuration for Unix/Linux
DocumentRoot "/home/webmaster/site/docroot/"
ScriptAlias /cgi-bin/ "/home/webmaster/site/docroot/cgi-bin"
```

```
# Sample Unsafe Configuration for Windows
DocumentRoot "C:/webmaster/site/docroot"
ScriptAlias /cgi-bin/ "C:/webmaster/site/docroot/cgi-bin/"
```

Accessing a script in the cgi-bin directory:

<http://www.example.com/cgi-bin/somescript>

Exploit:

<http://www.example.com/CGI-BIN/somescript>

# Insecure Configuration

## Apache URL Validation Vulnerability (BID 19447)

```
# Sample Safe Configuration for Windows
DocumentRoot "C:/webmaster/site/docroot"
ScriptAlias /cgi-bin/ "C:/webmaster/site/cgi-bin/"
```

Accessing a script in the cgi-bin directory:

<http://www.example.com/cgi-bin/somescript>

Exploit URL is now invalid:

<http://www.example.com/CGI-BIN/somescript>

# Insecure Configuration

## Prevention:

- Configure all security mechanisms
- Turn off all unused services
- Set up roles, permissions and accounts
- Disable all default accounts or change their passwords
- Enable logging and alerts
- Monitor the latest security vulnerabilities published
- Apply the latest security patches
- Update the security configuration guidelines
- Scan for vulnerabilities with a vulnerability scanner regularly

Thank You!
